Summary

I'm a frontend engineer from El Salvador. Right now, I'm working at a leading telecom company, building and maintaining a UCaaS platform. I love digging into TypeScript and finding creative ways to solve problems and build awesome user experiences. I'm a huge fan of learning new things and taking on challenges—whether it's exploring new frameworks, improving my skills, or just figuring out how to make stuff work better.

Experience

Ooma Inc, Frontend Engineer L2

Mar 2024 – present

- Develop new modules for a UCaaS platform as part of an 8-person team, taking features from early requirements all the way to production.
- Build cross-tenant applications and microfrontends that adapt to each customer's setup, collaborating with multiple teams to coordinate versioning and get their releases shipped.
- Publish and maintain shared npm packages on top of our internal design system, so components stay consistent and reusable across every microfrontend instead of being rebuilt.
- Use WebSockets to keep the UI in sync with real-time data, handling live updates smoothly without forcing full page refreshes.
- Translate PRDs and design mockups into pixel-perfect, robust features, handling edge cases carefully before they reach production.
- Review code to keep it clean, share ideas, and help the team write more readable, maintainable code through consistent feedback.
- Use AI to speed up my workflow by building custom skills and plugins that automate repetitive tasks and cut down on boilerplate.

2600Hz, Software Engineer

Mar 2023 – Feb 2024

- Implemented new features and maintained existing functionality for a UCaaS platform built with React microfrontends orchestrated through SingleSPA, keeping each app independently deployable.
- Enhanced and supported a desktop application built with Electron, wiring main and renderer process communication and keeping it in sync with the web platform.
- Proposed and built proofs of concept for new features, then worked with the team to turn the best ideas into production work.
- Consumed real-time data events over WebSockets, optimizing data structures and the update flow so the UI stayed responsive under heavy event traffic.
- Worked closely with product and design to translate requirements into shipped features, and reviewed code to keep it clean, consistent, and readable.

Education

University of El Salvador, Bachelor's Degree in Computer Systems Engineering

Feb 2019 – Dec 2023

The first semesters were heavy on math and physics, which is where I learned to break a problem into smaller pieces and work through it step by step. I also led a few team projects along the way, splitting up the work and keeping everyone on the same page. What stuck with me most, though, is a self-taught mindset: reading the docs, testing ideas on my own, and figuring things out instead of waiting for someone to hand me the answer.

- Cum laude

Online Courses

- Coursera, Python for Everybody Specialization
- Coursera, Intermediate PostgreSQL
- Google Cloud Skills Boost, Develop Serverless Applications on Cloud Run.

Skills

Skills: React, Next.js, MongoDB, Drizzle ORM, Node.js, Express, Electron, Zustand, TypeScript, Python

Volunteering

Glasswing International, Robotics Instructor

Feb 2021 – Dec 2022

- Taught high school students the fundamentals of programming and robotics.
- Guided students in developing abilities that will help to solve problems using algorithms and soft skills.
- Collaborated in organizing and facilitating multi-school robotics tournaments.

Interests

- **Professional:** micro frontend architecture, webRTC, websockets, API building, data science.
- **Hobbies:** electronics, gaming, PC building, gym training.
